Welcome to AP Chemistry!

Students enrolled in AP chemistry will be asked to reinforce skills and knowledge accumulated in the first year chemistry class (Honors Chemistry) during the summer before the beginning of the AP course. This will allow us to focus our attention on the advanced chemistry topics and 16 suggested labs that will be tested on the AP exam in May 2024.

Your summer assignment consists of the following:

- 1. **Review the objectives** taught in Chemistry Honors for the Atomic Structure & Periodicity, Stoichiometry and Chemical Reactions units. **A diagnostic exam to test your readiness for AP Chemistry will be given** the second day the class meets.
- 2. Review the Solubility Rules, Polyatomic Ions, Strong Acids and Bases, and General Rules for Completing Chemical Equations (all attached). All these will be tested in the diagnostic test.
- 3. **Lab preparation.** Go to the website below and read all the Glassware and Techniques. This is important as some questions on the AP test require knowledge of these. Your knowledge of these glassware and techniques will be also tested in the diagnostic test. https://www.michigan.gov/documents/deq/wrd-ot-lab-glassware-445272 7.ppt
- 4. Answer ALL questions on the assignment included in this document (pages 4 through 10) in the space provided. Assignment is **due on the first day of school.**

Please take the assignment seriously and start in early August—there's a lot to do and you won't be able to complete it all on the night before it's due.

If at any time you would like to ask me a question, please email me at agarciaminsal@dadeschools.net. Have a great summer. I look forward to beginning our journey together in August.

Mrs. Minsal ©

Polyatomic Ion Names

Must be memorized by the first day of school!

```
<u>1+</u>
ammonium, NH<sub>4</sub>+
hydronium, H<sub>3</sub>O+
<u>1-</u>
acetate, C_2H_3O_2-, or CH_3COO-
perchlorate, ClO<sub>4</sub>-
chlorate, ClO<sub>3</sub>-
chlorite, ClO<sub>2</sub>-
hypochlorite, ClO-
cyanide, CN-
hydrogen carbonate, HCO<sub>3</sub>- (also called bicarbonate)
hydrogen sulfate, HSO<sub>4</sub>-
hydroxide, OH-
nitrate, NO<sub>3</sub>-
nitrite, NO<sub>2</sub>-
permanganate, MnO<sub>4</sub>-
thiocyanate, SCN-
2-
                                                                                                                    <u>3-</u>
carbonate, CO<sub>3</sub> <sup>2-</sup>
                                                                                                                    phosphate, PO<sub>4</sub> 3-
chromate, CrO<sub>4</sub><sup>2-</sup>
                                                                                                                    phosphite, PO<sub>3</sub> 3-
dichromate, Cr<sub>2</sub>O<sub>7</sub><sup>2-</sup>
                                                                                                                    arsenate, AsO<sub>4</sub> 3-
oxalate, C<sub>2</sub>O<sub>4</sub> <sup>2-</sup>
peroxide, O<sub>2</sub><sup>2</sup>-
sulfate, SO<sub>4</sub><sup>2</sup>-
sulfite, SO<sub>3</sub> <sup>2-</sup>
thiosulfate, S<sub>2</sub>O<sub>3</sub><sup>2</sup>-
```

Strong Acids Strong Bases.

HCl Group I hydroxides (LiOH, NaOH, KOH, etc)

HBr Ca(OH)₂

HI Sr(OH)₂

 H_2SO_4 Ba(OH)₂

 HNO_3

 $HClO_4$

 $HClO_3$

Solubility Rules (PAGAN)

- 1. All compounds that contain a Group I element (alkali metal) are soluble.
- 2. All compounds that contain an \underline{A} mmonium ion (NH₄⁺) are soluble.
- 3. All compounds that contain a \underline{N} itrate ion (NO₃⁻), \underline{A} cetate ion (C₂H₃O₂⁻), and \underline{P} erchlorate ion (ClO₄⁻) are soluble.
- 4. All other compounds are INSOLUBLE, unless otherwise noted.

| | Name: | Date: | | | |
|--------|---|--|--|--|--|
| | AP Chemistry | Mrs. Minsal | | | |
| | | Due on Monday August 21st. | | | |
| | <u>Directions</u> : Answer the following | five questions in the spaces provided. | | | |
| 1. | Explain each of the following obs | servations using principles of atomic structure | | | |
| a) | Write the ground state electron | configuration for a chlorine <u>atom</u> . | | | |
| b) | _ | ne ion. | | | |
| c) | c) Write the ground state electron configuration for a chlorine <u>ion.</u> | | | | |
| d) | Is an isolated chlorine atom in th | ne ground state paramagnetic or diamagnetic? Explain. | | | |
| | | | | | |
| e) | | uration of the chlorine atom in the ground state is consistent with the n compounds: NaCl, SCl ₂ . Use Lewis structures is necessary. | | | |
| | | | | | |
| | | | | | |
| | | | | | |
| f) | Write the ground state electron configuration for an iron <u>atom</u> . | | | | |
| g) | Write the ground state electron of | configuration for iron(III) <u>ion</u> . | | | |
| 2. | _ | servations using principles of atomic structure. | | | |
| a) | Potassium has a lower first-ioniz | zation energy than lithium. | | | |
| | | | | | |
| | | | | | |
| | | | | | |

| b) | The ionic radius of N^{3-} is larger than that of O^{2-} . | | |
|----|---|--|--|
| | | | |
| | | | |
| | | | |
| | | | |
| c) | A chlorine atom is smaller than a magnesium atom. | | |
| | | | |
| | | | |
| | | | |
| | | | |
| 3. | Calculate the volume, in liters, of 0.589 M $\rm H_2SO_4$ that can be completely neutralized with 2.46 grams of sodium bicarbonate NaHCO ₃ . | | |
| | | | |
| | | | |
| | | | |
| | | | |
| 4. | a) Write the net ionic equation for the neutralization reaction between solutions of nitric acid and barium hydroxide. | | |
| b) | The molarity of nitric acid is to be determined using titration. A 25.00 mL sample of the acid is titrated | | |
| | with 0.100 M of barium hydroxide. The equivalence point was achieved with 48.6 mL of the base. Calculate the molarity of the nitric acid. | | |
| | | | |
| | | | |
| | | | |
| | | | |
| c) | What is the pH of the nitric acid? | | |
| | | | |

5. Answer the following questions about MgSO₄(s) and its hydrate.

When heated to 310.°C, MgSO₄ · X H_2O (s) dehydrates completely as represented below.

$$MgSO_4 \cdot X H_2O(s) \rightarrow MgSO_4(s) + X H_2O(g)$$

A student weighs an empty clean and dried crucible, adds some of the hydrate to the crucible and weighs the crucible again. Then the student heats up the crucible at 310.°C for 10 minutes, lets the crucible + residue cool down and weighs again. The student repeats this last step again. The table below contains data collected by the student during the experiment.

| Mass of empty crucible | 6.849 g |
|---|----------|
| Mass of crucible and MgSO ₄ · X H ₂ O | 12.330 g |
| Mass of crucible and MgSO ₄ after first heating | 9.589 g |
| Mass of crucible and MgSO ₄ after second heating | 9.587 g |

- a) Calculate
 - i. The mass of MgSO₄ (s) formed.
 - ii. The mass of water contained in the hydrate.
 - iii. The volume of the H₂O(g) released, measured at STP conditions.
 - iv. The empirical formula of the hydrate, MgSO₄ \cdot X H₂O

b) Identify sources of possible errors in the experiment that could explain the experimental results.

| 6. | A 2.00 x 10 ⁻³ mole sample of pure acetylsalicylic acid (a monoprotic acid, MM: 180.157g/mol) was |
|----|--|
| | dissolved in enough water to make 15.00 mL of solution and then titrated with 0.100 M NaOH(aq). |
| | Calculate: |

- a) The molarity of the acetylsalicylic acid.
- b) The number of molecules of acetylsalicylic acid in the solution before titration.
- c) The volume of NaOH required to react with the acid.

7.
$$Fe(s) + O_2(g) \longrightarrow Fe_2O_3(s)$$

Iron reacts with oxygen to produce iron(III) oxide, as represented by the equation above.

A 65.0 g sample of Fe(s) is mixed with 21.0 L of $O_2(g)$ at 25.0°C and 763.4 torr

- a) Identify the substance that is oxidized and the one being reduced.
- b) Calculate the number of moles of each reactant before the reaction begins.

c) Identify the limiting reactant when the mixture is heated to produce $Fe_2O_3(s)$. Support your answer with calculations.

| d) | Calculate the number of moles of Fe_2O_3 (s) produced when the reaction proceeds to completion. | |
|------|--|--|
| 8. | Aqueous XO_4^{3-} form a precipitate with aqueous silver ions, Ag^+ . Write the net ionic equation for the reaction, including the state symbols. | |
| a) | Excess of aqueous K_3XO_4 is added to 41.18 mL of a 0.2040 M solution of $AgNO_3$ to force all the product to precipitate. The mass of the precipitate formed is 1.172 g. i. Calculate the amount, in moles, of Ag^+ ions used in the reaction. | |
| | ii. Calculate the moles of the precipitate formed from the Ag+ ions. | |
| | iii. Calculate the molar mass of the precipitate. | |
| | iv. Determine the atomic mass of X and identify the element. | |
| | | |
| 9. | | |
| i. | Draw the Lewis structure. | |
| ii. | State the molecular symmetry. | |
| iii. | State the strongest intermolecular force present between the molecules of the same compound. | |

| a) CF ₄ | | | | | | |
|-----------------------|----------|-----|--|--|--|--|
| i | ii | iii | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| b) NCl ₃ | | | | | | |
| i | ii | iii | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| c) H ₂ O | | | | | | |
| i | ii | iii | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| d) CH ₃ OH | <u> </u> | | | | | |
| i H | ii | iii | | | | |
| 1 | | | | | | |
| H – C – O – H | | | | | | |
| I | | | | | | |
| Н | | | | | | |
| e) CO ₂ | | | | | | |
| i | ii | iii | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |

| 10. Propanoic acid, HC ₃ H ₅ O ₂ , is a weak monoprotic acid | l. The equation for the dissociation of propanoic acid |
|---|--|
| is described below: | |

$$HC_3H_5O_2(aq) + H_2O(l) \rightleftharpoons C_3H_5O_2^-(aq) + H_3O^+(aq)$$

a) On the lines above, identify the acid -conjugate base and base-conjugate acid pairs.

A student titrates 25.00 mL of the acid with 0.124 M NaOH. The end point used 23.59 mL of the base.

- b) Write the balanced chemical equation between propanoic acid and NaOH.
- c) Calculate the concentration of the acid.
